ethanesulfonic, benzenesulfonic, p-toluenesulfonic acid or the like.

The compounds of the present invention are serine protease inhibitors, and in particular may inhibit thrombin, Factor Xa, and/or trypsin. The Part B(1) tartrate salt (1.0 g) was dissolved in water (5 mL) and a solution of potassium carbonate was added to bring the pH to 9. The solution was cooled in an ice water bath and ether (5 mL) was added. Benzyl chloroformate (0.5 mL) was added dropwise to the well-stirred solution. During the addition, the pH was maintained between 8 and 9 by addition of potassium carbonate solution. After addition was complete, the mixture was stirred cold for an additional 1.5 hours, maintaining the pH throughout this period. The layers were separated and the aqueous was reextracted with ether. The combined ether layers were dried over magnesium sulfate and concentrated *in vacuo*. The ethyl ester obtained was purified on silica gel, the purified material (930 mg) was dissolved in methanol (8 mL) and treated with 1 N NaOH solution (4 mL). After stirring at room temperature two hours, the methanol was removed *in vacuo*. The aqueous solution was acidified with 1 N HCl and the acid was extracted into ethyl acetate (2 x 10 mL), the combined extracts dried over magnesium sulfate and concentrated *in vacuo* to give title compound as a crystalline solid. (773 mg).  $[\alpha]_D = +49.9^\circ$  (c = 1.4, MeOH). The optical purity of this material was determined by coupling some of this material with (S)-(-)-a-methyl-benzylamine. The material obtained was submitted to analytical HPLC for determination of purity and was found to be 97.6%, (e.e. = 95.2%).
